Manual QA Testing Report

Mobile App Application Testing Focus

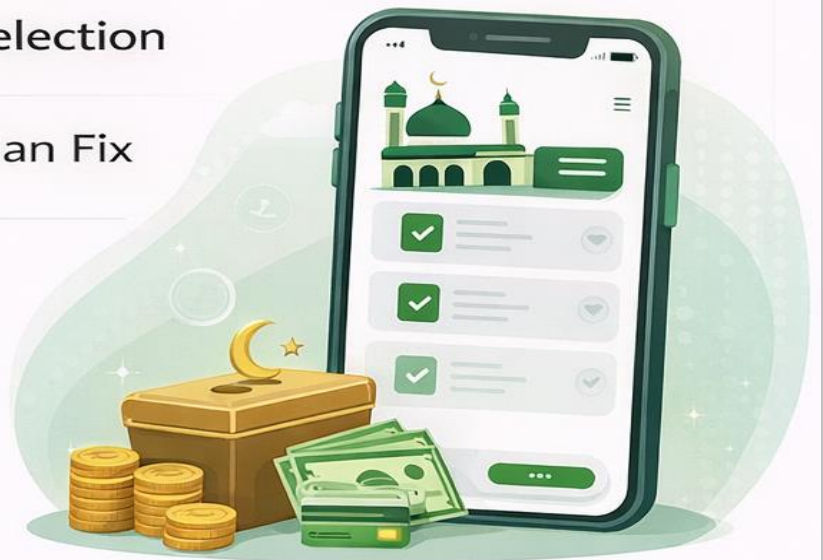

Masjid & Location Selection (Souqya Joud)

Multiple Package Selection

Sponsor Payment Plan Fix

Testing Date

02 February 2026

Environment

Production / Live App

Tested By

Abida Gul
(Manual Tester)

1. Issue Type: Bug

Summary:

Ramadan contribution/campaign is missing in the mobile app

Description:

The **Ramadan Contribution/Campaign** section is currently not available in the **mobile app**. Users are unable to view or contribute through the Ramadan campaign from the app.

These results in missing time-sensitive campaign content on mobile and may reduce engagement/contributions.

Environment:

- Platform: Mobile App (iOS/Android)
- Environment: Live / Production
- App Version: (Add version if available)
- Device: (Add device model if available)

Preconditions:

- User is logged in (if required)
- Ramadan campaign should be active/published in the system

Steps to Reproduce:

1. Open the mobile app.
2. Navigate to the **Contributions / Campaigns** section.
3. Check the list of available campaigns.
4. Search for **Ramadan** (if search exists).

Actual Result:

- **Ramadan Contribution/Campaign is not displayed** in the mobile app

Expected Result:

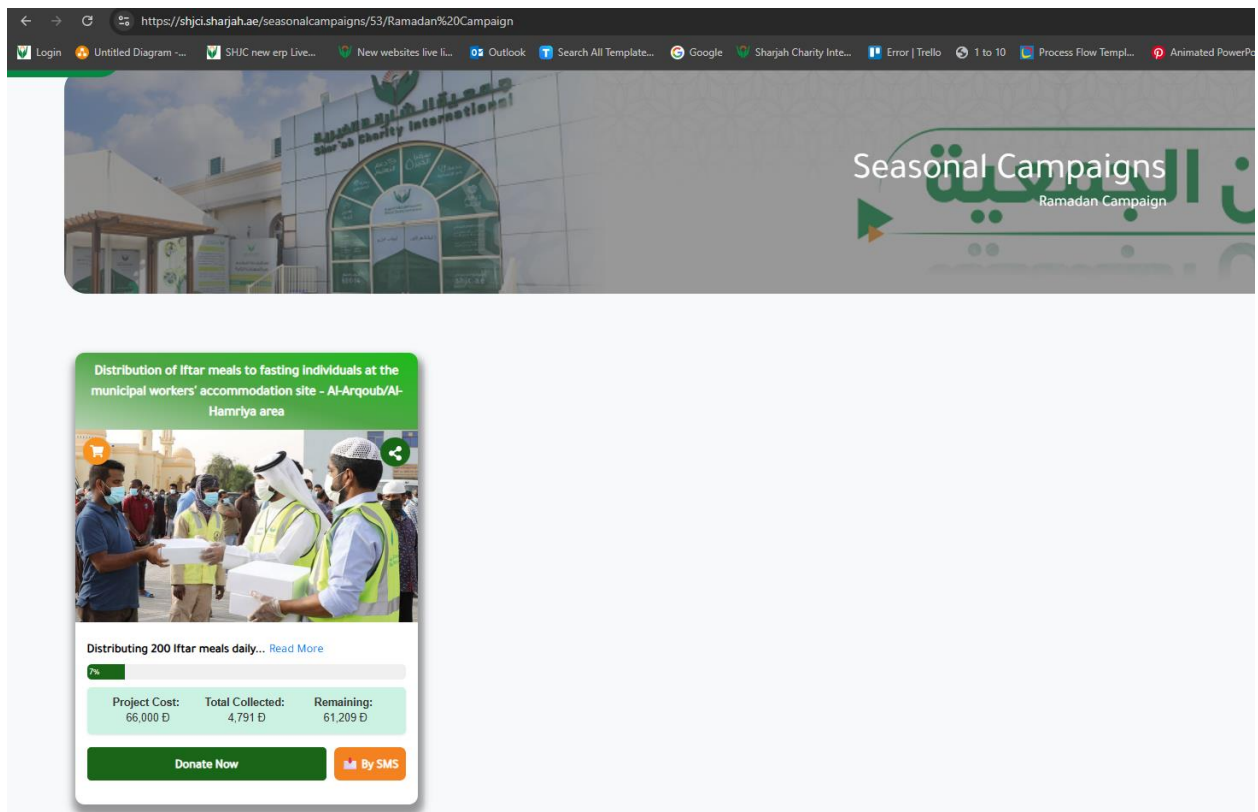

- Ramadan Contribution/Campaign should be visible in the mobile app under Contributions/Campaigns (same as configured in the system).

Severity:

Medium to High (business impact depends on campaign priority)

Priority:

High (Campaign visibility is time-sensitive)

2. Issue Type: Bug

Summary:

Multiple loaders appear repeatedly in internal → Mosque project and its sub-sections (Mobile App)

Description:

In the mobile app, when the user opens the **internal section** and selects a **Mosque project**, the UI displays **multiple loaders** (repeated loader/spinner instances). This loader behavior continues when navigating into **internal sub-sections**, creating a flickering/stacked loader experience and making the screen look unstable.

This is a UI/UX issue and may indicate duplicate API calls or improper loading-state handling.

Environment:

- Platform: Mobile App
- Environment: Live / Production
- OS: iOS/Android (reproducible)
- Network: Normal + slow network conditions

Preconditions:

- User is logged in (if required)

- Internal section is accessible
- Mosque project exists in Internal section

Steps to Reproduce:

1. Open the mobile app.
2. Navigate to **Internal** section.
3. Open any **Mosque project**.
4. Observe the loader behavior during page load.
5. Navigate to any **sub-section** within Internal.
6. Observe loader behavior again.

Actual Result:

- Loader shows **multiple times / multiple loaders appear** on the same screen.
- Loader flickers or keeps reappearing when opening internal sub-sections.
- Screen experience looks unstable and inconsistent.

Expected Result:

- Only **one loader** should appear per screen load.
- Loader should display once, and then disappear smoothly after content loads.
- Sub-sections should not trigger duplicate loaders unless a genuine reload is required.

Severity:

Medium (UI/UX impact, may hint at underlying performance issues)

Priority:

Medium to High (if it affects core navigation and usability)

3. Issue Type: Bug

Summary:

Text becomes blurred and some content disappears after staying on Mosque/Other section detail screen (Mobile App)

Description:

In the mobile app, when the user opens the **Mosques section** (or any other section) and navigates to a **detail screen**, after some time the text on the screen becomes **blurred** and parts of the content appear to be **removed/disappear** automatically. This affects readability and makes the detail screen unusable.

Environment:

- Platform: Mobile App
- Environment: Live / Production
- OS: iOS / Android (confirm if happening on both)
- Devices: (Add device models if available)
- App Version: (Add version if available)
- Network: Normal / slow (if observed)

Preconditions:

- User can access Mosques section (or other section)
- A detail page is available to open

Steps to Reproduce:

1. Open the mobile app.
2. Navigate to **Mosques** section (or any other section).
3. Open any **detail page**.
4. Stay on the screen for some time (e.g., 10–60 seconds).
5. Observe the text and layout.

Actual Result:

- After some time, text becomes **blurred** on the screen.
- Some text/content blocks become **missing/disappear**.
- Screen content is not stable and readability is impacted.

Expected Result:

- Text should remain **clear and readable** at all times.

- No content should disappear unless the user navigates away or refreshes intentionally.
- UI should remain stable while staying on a detail page.

Severity:

High (Impacts usability and readability of key content)

Priority:

High

Frequency:

Intermittent / frequent (as observed)
